

Riley Chen

Customer Support Specialist

Resume: 75/100 | Interview: 75/100 | Overall: 75/100

Customer service professional developing technical support and escalation skills.

Simulated interview analysis and signals

Clarity: 80% | Confidence: 75% | Engagement: 83%

Evaluation reliability: 71% | AI-aided response risk: Low

Conditions: Adequate | Signal confidence: Moderate | Audio issues: Minor | Distraction: Medium | Integrity: Low

Provides understandable customer updates and basic browser checks, but needs stronger escalation and prioritization structure. The simulated presentation is engaged with moderate confidence; use a triage exercise to test process maturity.

All values above are synthetic display examples. No real audio/video was analyzed and no real integrity assessment was performed.

Customer communication: 80/100 (weight 30%)

Describe a frustrated customer interaction and how you responded.

A customer was upset about an order delay. I acknowledged it and checked the order, then explained the next delivery estimate. I followed up the next day. I did not have a written update schedule, but the customer thanked me for checking back.

Troubleshooting: 72/100 (weight 30%)

Walk me through diagnosing a customer who cannot access their account.

I ask what error they see and suggest trying another browser. If that fails I send it to the lead. I have not routinely checked service health or account state myself. I would not ask for their password, and I would record the exact error.

Prioritization and escalation: 69/100 (weight 20%)

How do you prioritize competing tickets and decide when to escalate?

I usually work oldest tickets first, but would move an urgent issue up if my lead asked. I do not yet use a formal impact matrix. Once I escalated several related tickets separately and later learned we should link them under one incident.

Documentation and privacy: 76/100 (weight 20%)

What do you record in case notes and what information should you avoid collecting?

I write the issue and what I tried in the ticket. I never record a password. I am still learning which screenshots require redaction and when a case should go to the restricted security queue.

Limitations and follow-up

Specific gaps concern process maturity, not unobserved personal traits.

Use a triage exercise to test business-impact prioritization and privacy-safe escalation notes.

No real interview, recording, perception analysis, or integrity assessment exists. All evidence is an authored fictional transcript.
